

Smart Kitchen Technology

Kitchen appliances aren't just for making meals anymore. They can keep track of your family's schedule, show you who is standing on your front door, or continue playing the movie you were watching in your living room as you grab another snack.

Appliances can be controlled wirelessly so you can check from soccer practice inside your fridge if you have any Gatorade left, or turn on your dishwasher after you already left the house. *(And your mom reminded you to do so only 5 times before you walked out the door.)*

Appliances can also be controlled just short of telekinesis. You can walk into your kitchen and all the lights will automatically turn on. Say "open can" and your garbage can will open up, and wave your hand and the water and soap will come out from your sink.

Task:

Do some research of some smart kitchen technology you would like to incorporate into your design. These can be large appliances such as refrigerators or ovens, to small countertop appliances such as toasters. Look also into things such as lighting or sound systems. **Try to find at least 3 items.**

When you find the items you would like to use, be sure to include some specifics such as:

1. Picture
2. Name/ Model Number
3. Cost
4. Vendor

Compile this information in an organized and well defined manner.
